

KRACHT

**Transfer Gear Pumps**  
**KF 4 ... 80**

# Applications from A to Z

## Applications

Machine-building industry  
 Manufacture of apparatus  
 Filling stations  
 Waste oil

- disposal
- transport
- treatment

Coating machines

Printing machines  
 Metering systems

Heavy electrical machines

Paint industry  
 Filter systems

Generator construction  
 Transmission building  
 Plain metal bearing production  
 Rubber and tire manufacturing

Engine construction  
 Refrigerators  
 PUR machinery

Marine engine construction  
 Lubricating oil systems  
 Lubricant manufacturers

Turbine construction  
 Tank plant construction  
 Metal-forming machines

Compressors  
 Vacuum machinery

Heat transfer systems  
 Machine tools

Centrifuge construction

## Suitable fluids

Waste oils

Soluble oils

Diesel oils  
 Printing inks

Emulsions  
 Dyes  
 Fats  
 Antifreeze

Gear oils

Resins  
 Hardening oils  
 Fuel oils, L, EL, H  
 Hydraulic fluids

Isocyanate

Adhesives  
 Plastics

Engine oils

Nitrocellulose lacquers

Paraffins  
 Polyols

Lubricating oils  
 Cutting oils  
 Heavy oils

Heat transfer media  
 Processing oils  
 Waxes  
 Rolling oils

Drawing compounds

# Descriptions

## Product features

KF gear pumps are used for pumping a wide variety of fluids.  
 KF gear pumps are distinguished especially by their wide range of variants which are assembled as required on the modular principle and also permit subsequent upgrade.  
 The pumps are also suitable for media with low lubricating properties.  
 The standard housing sections are of grey cast iron.  
 The gear units are manufactured from high-strength case-hardening steel, hardened and mounted in special multi-compound plain bearing bushes.  
 The standard drive shaft is sealed by rotary shaft lip-type seal.  
 All pump sizes incorporate helical tooth system.  
 This feature, combined with special gear geometry, results in extremely low noise levels and reduced pressure pulsation.

## Variants:

- Sealing of the drive shaft
- Rotary shaft lip-type seal
- Double rotary shaft lip-type seal (Quench)
- Mechanical seal
- Outboard bearing to take up input drive-side radial load
- Pressure relief valve as safety valve for pump and system
- Uniform discharge flow direction with changing direction of rotation by means of flange-mounting valve combination (universal device).

## Special design

Various shafts ends and gear units, as well as flange mounted versions, bearing alternatives, multi-stage pump combinations for your special application are available on request.  
 Our Sales engineers will be pleased to advise you.

## Accessories:

- Connecting flanges
- Couplings
- Bell housings

## Operating notes

- The fluids should ensure a certain minimum lubricating properties, should not contain solids and should be chemically compatible.
- Avoid dry operation.
- The pumps may only be operated in the specified direction of rotation, as otherwise the shaft seal will be destroyed.
- In order to prevent excessive overpressure, a safety valve should be provided in the system or on the pump.
- The pressure relief valve attached to the pump may only be used as safety valve for short-term operation.
- To drain off a partial discharge flow over a prolonged period, a separate pressure relief valve with return line must be inserted in the reservoir.
- A separate pressure relief valve with return line to the reservoir must be foreseen, if a partial discharge flow has to be drained over a prolonged period.

## Direction of rotation:

### The following should be noted for direction of rotation:

- when looking at the pump shaft end, the direction of pumping is from left to right if the shaft rotates **clockwise**.
- when looking at the pump shaft end, the direction of pumping is from right to left if the shaft rotates **counterclockwise**.

### without pressure relief valve

### with pressure relief valve

# Characteristics

14 Nominal displacement sizes  
 4...80 cm<sup>3</sup>  $V_g = 4/5/6.3/8/10/12.5/16/20/25 \text{ cm}^3$   
 32/40/50/63/80 cm<sup>3</sup>

Direction of rotations: cw **or** ccw  
 cw **and** ccw  
 Mounting type: flange DIN ISO 3019  
 Drive shaft end: ISO R 775 short/cyl.

## Operating pressure

### Suction side

$p_{e \text{ min}}$ : -0.4 bar (vacuum)  
 briefly on startup -0.6 bar  
 with universal model restriction  $p_{e \text{ min}}$   
 $p_{e \text{ max}}$ : 1 bar for NBR- and FPM rotary shaft lip-type seal  
 2 bar for PTFE-lip-type seal  
 10 bar for mechanical seal  
 (higher pressures on request)

### Pipe connection

Nominal size 4...25: Whitworth pipe thread  
 Nominal size 32...80: SAE flange

### Fluid temperature

$\vartheta_{m \text{ min}}$  = -10°C  
 $\vartheta_{m \text{ max}}$  = 90°C for NBR lip-type shaft seal  
 = 150°C for FPM lip-type shaft seal  
 = 200°C for PTFE lip-type seal  
 = 150°C for GLRD with FPM aux. seals  
 = 200°C for GLRD with PTFE aux. seals

### Pressure side

$p_n$  = 25 bar (higher pressures on request)

Ambient temperature  $\vartheta_u$  = -20...60 °C

### Speed of rotations

Nominal size 4...80 200...3000 1/min

Mounting position: optional  
 (for exception, see Universal unit)

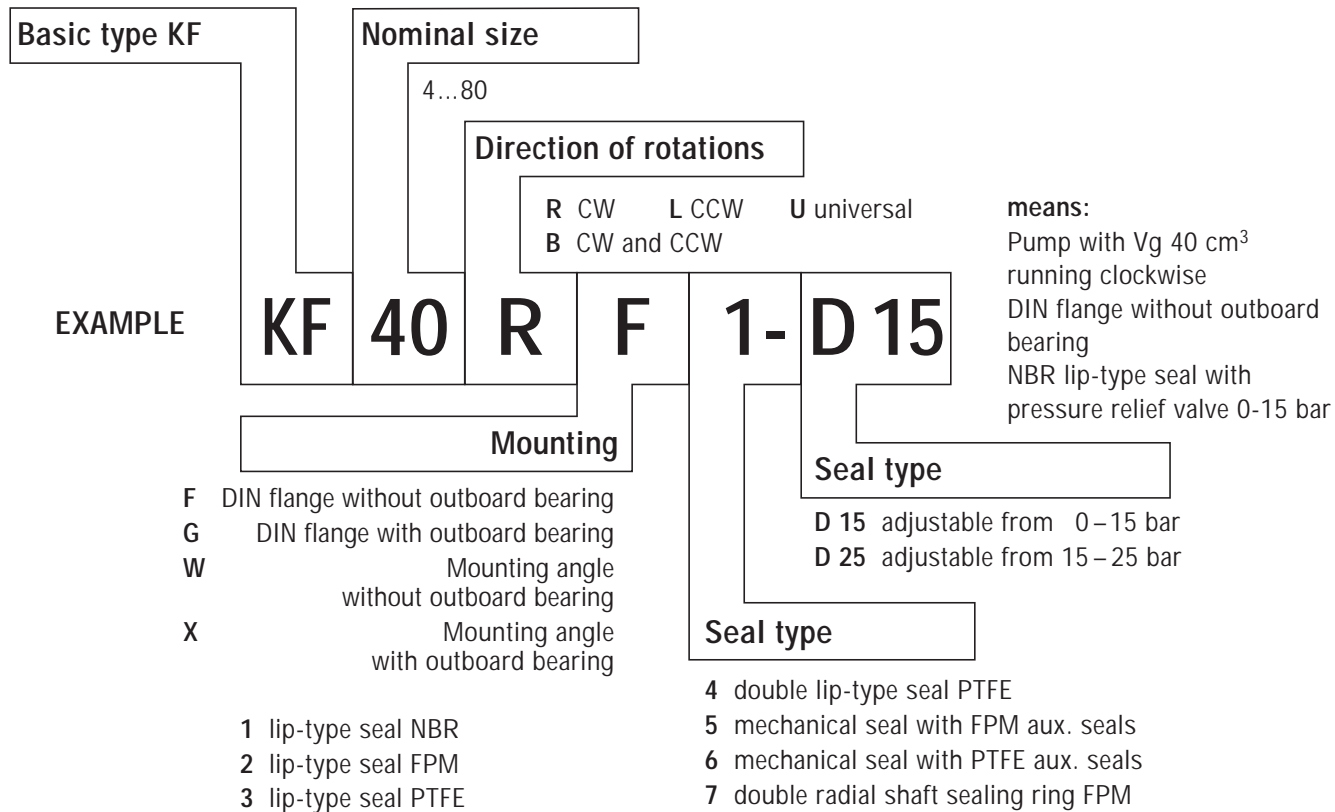

Viscosity  $\nu = 12...20,000$   
 (dependent on pressure and speed of rotations)

Discharge flow: see Table page 7  
 Drive power: see Table page 7 and 8

The ratings refer to a mineral oil with a viscosity of 34 mm<sup>2</sup>/s.

Margin of error for the flow Q +2,5%... -5% of the tabular value.  
For viscosity < 30 mm<sup>2</sup>/s, take a reduction of the rated flow Q into account.

The output of the drive motor should be selected 20% higher than tabular value P.

For viscosity > 100 mm<sup>2</sup>/s, an increase in the required power is necessary, in this case proceed as per description on page 8.

# Power consumption

Diagram:  $n, f_v = f(v)$

Note:  
 To determine the power consumption, always the max. operating viscosity at starting state.  
 The power of the drive motor should be selected 20% higher than the value determined.

## Calculation of power consumption

$$P_{1Pu} = P_{tab} \cdot \frac{n}{1450} + f_v \cdot Q$$

$P_{1Pu}$  = pump power consumption (kW)  
 $P_{tab}$  = power consumption per table (kW)  
 $n$  = speed (1/min)  
 dependent on viscosity!  
 $f_v$  = viscosity factor  $\left[ \frac{\text{kW}}{\text{l/min}} \right]$   
 see diagram  
 $Q = \frac{V_g \cdot n}{1000}$  where  $Q$  = discharge flow (l/min)  
 $V_g$  = geometrical displacement (cm<sup>3</sup>)

## Example: Pump-type KF 80

Viscosity	$v = 3000 \text{ mm}^2/\text{s}$
Operating pressure at	$p = 15 \text{ bar}$
	$P_{tab} = 3.6 \text{ kW}$
	$n = 500 \text{ 1/min}$
	$f_v = 0,017 \frac{\text{kW}}{\text{l/min}}$
	$Q = 40 \text{ l/min}$

becomes

$$P_{1pu} = \left( 3.6 \cdot \frac{500}{1450} + 0.017 \cdot 40 \right) \text{ kW}$$

$$P_{1Pu} = 1.92 \text{ kW}$$

Motor power output:	$P_{2Mot} = 1.2 \cdot P_{1Pu} = 2.3 \text{ kW}$
Select helical geared motor with	$P = 3.0 \text{ kW}$
	$n = 500 \text{ 1/min}$

## Conversion factors

$1 \text{ bar} \hat{=} 14.5 \frac{\text{lb}}{\text{in}^2} = 14.5 \text{ psi}$   
 $1 \frac{\text{l}}{\text{min}} \hat{=} 4.546 \frac{\text{gal}}{\text{min}} = [\text{U.K.}]$   
 $1 \frac{\text{l}}{\text{min}} \hat{=} 3.785 \frac{\text{gal}}{\text{min}} = [\text{US}]$

## Speed recommendation

Kinematic viscosity $v \text{ mm}^2/\text{s}$										
<	300	300	500	1000	2000	3000	6000	10000	20000	30000
≥	1500	1250	1000	750	600	500	400	300	200	100
Speed $n_{max} \text{ 1/min}$

## Note:

All pump and Motor sizes can be combined.

Motor frame sizes are based on ABB. Other manufactures motors can be supplied on request as IM B35.

# Accessorie: Connections

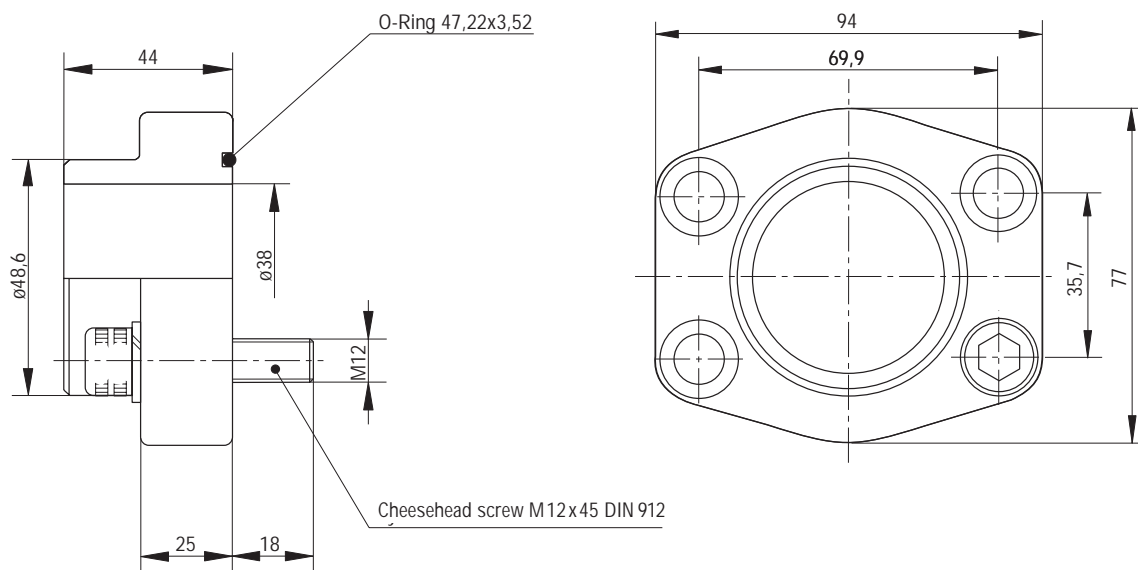

## Bolt-on flange

G-SAE 1 1/2 - N  
 Weight 1.2 kg - F  
 - P

## Welding flange

G-SAE 1 1/2 - N  
 Weight 1.2 kg - F  
 - P

N = NBR -O-Ring  
 F = FPM -O-Ring  
 P = PTFE -O-Ring

## VOLUTRONIC®

**For measurements our tolerance keeps within narrow limits**

- VOLUTRONIC®, that means highly dynamic, precise volume and through-flow measurements, evaluated with application orientation, from simple display equipment up to intelligent microcontroller-solutions, from simple flow controls up to complex adjustment.
- The basis for this: The VC-Standard volume meter. A development from our engineers.
- Top international technology which you can rely on.

## ELECTRONIC

**Measure, control, adjust.**

- High performance KRACHT Electronics ensure that processes are monitored precisely, adjusted and controlled.
- For example, in process technology as microcontroller for dosage and mixing systems –
- or as compact and robust mobile electronics for hydraulic motors –
- or as future-orientated SPS technology for complete solution with KRACHT Hydraulics Plant –
- or as flexible measuring and recording electronics for differentiated applications in test bed technology.
- KRACHT technology and know-how guarantee functional solutions. Standardised and application-optimised.

## Overview of our complete program

### Transfer pumps

Transfer pumps for lubricating oil supply equipment, low pressure filling and feed systems, dosing and mixing systems.

### Volutronic®

Gear flow meters and electronics for volume and flow metering technology in hydraulics, processing and laquering technology.

### Mobile hydraulics

Single and multistage high pressure gear pumps, hydraulic motors and valves for construction machinery, vehicle-mounted machines.

### Industrial hydraulics

Cetop directional control and proportional valves, hydraulic cylinders, pressure, quantity and stop valves for pipe and slab construction, hydraulic accessories for industrial hydraulics (mobile and stationary use).

With our decades of experience, we are at your side, world-wide, for the professional mastery of specific applications and complete solutions in hydraulics and process technology.
